¿QUE ES EL IICA?

El Instituto Interamericano de Cooperación para la Agricultura (IICA) es el organismo especializado en agricultura del Sistema Interamericano. Sus orígenes se remontan al 7 de octubre de 1942 cuando el Consejo Directivo de la Unión Panamericana aprobó la creación del Instituto Interamericano de Ciencias Agrícolas.

Fundado como una institución de investigación agronómica y de enseñanza de posgrado para los trópicos, el IICA, respondiendo a los cambios y a las nuevas necesidades del Hemisferio, se convirtió progresivamente en un organismo de cooperación técnica y fortalecimiento institucional en el campo agropecuario. Estas transformaciones fueron reconocidas formalmente con la ratificación, el 8 de diciembre de 1980, de una nueva convención, la cual estableció como los fines del IICA los de estimular, promover y apoyar los lazos de cooperación entre sus 31 Estados Miembros para lograr el desarrollo agrícola y el bienestar rural.

Con un mandato amplio y flexible y con una estructura que permite la participación directa de los Estados Miembros en la Junta Interamericana de Agricultura y en su Comité Ejecutivo, el IICA cuenta con una amplia presencia geográfica en todos los países miembros para responder a sus necesidades de cooperación técnica.

Los aportes de los Estados Miembros y las relaciones que el IICA mantiene con 12 Países Observadores Permanentes, y con numerosos organismos internacionales, le permiten canalizar importantes recursos humanos y financieros en favor del desarrollo agrícola del Hemisferio.

El Plan de Mediano Plazo 1987-1991, documento normativo que señala las prioridades del Instituto, enfatiza acciones dirigidas a la reactivación del sector agropecuario como elemento central del crecimiento económico. En función de esto, el Instituto concede especial importancia al apoyo y promoción de acciones tendientes a la modernización tecnológica del agro y al fortalecimiento de los procesos de integración regional y subregional.

Para lograr esos objetivos el IICA concentra sus actividades en cinco áreas fundamentales que son: Análisis y Planificación de la Política Agraria; Generación y Transferencia de Tecnología; Organización y Administración para el Desarrollo Rural; Comercialización y Agroindustria; y Salud Animal y Sanidad Vegetal.

Estas áreas de acción expresan, de manera simultánea, las necesidades y prioridades fijadas por los mismos países miembros y los ámbitos de trabajo en los que el IICA concentra sus esfuerzos y su capacidad técnica, tanto desde el punto de vista de sus recursos humanos y financieros como de su relación con otros organismos internacionales.

Son países miembros del IICA: Antigua y Barbuda, Argentina, Barbados, Bolivia, Brasil, Canadá, Chile, Colombia, Costa Rica, Dominica, Ecuador, El Salvador, Estados Unidos, Grenada, Guatemala, Guyana, Haití, Honduras, Jamaica, México, Nicaragua, Panamá, Paraguay, Perú, República Dominicana, Santa Lucía, San Vicente y las Granadinas, Suriname, Trinidad y Tobago, Uruguay y Venezuela.

Países Observadores Permanentes: Austria, Bélgica, España, Francia, Israel, Italia, Japón, Países Bajos, Portugal, República Árabe de Egipto, República de Corea y República Federal de Alemania.

INTRODUCCION

La lucha contra las enfermedades y plagas de los animales que disminuyen la producción, que limitan la productividad, que entorpecen el comercio, y que representan un riesgo para la salud pública, ha sido una acción que durante siglos ha sido ejecutada en todos los países del mundo.

Tratando de utilizar los conocimientos más avanzados para su diagnóstico, prevención y control, productores y autoridades han tratado de unir sus esfuerzos para disminuir el impacto de esos problemas.

Sin lugar a duda los adelantos logrados hasta el presente para: la conceptualización global de los problemas zoosanitarios, los avances en las tecnologías de diagnóstico y de producción de biológicos y fármacos para su prevención y control, y la erradicación de enfermedades y plagas específicas en algunos países, constituyen pasos muy importantes para mejorar la condición sanitaria de las explotaciones pecuarias de los países.

No obstante, sólo hasta años recientes se ha empezado a estudiar sistemáticamente el impacto económico directo e indirecto que las enfermedades y plagas representan en la producción, productividad y comercialización pecuaria.

Aún cuando todos los sectores involucrados siempre han estado conscientes de la importancia de tales problemas en las economías de sus explotaciones, han sido muy limitados los estudios que se han realizado para evaluar con precisión las pérdidas reales ocasionadas por los mismos.

Entre las ventajas que se pueden obtener del conocimiento de la distribución e impacto económico de las enfermedades y plagas cabe destacar: a) la definición de prioridades para la implementación de programas oficiales de control y erradicación, b) el desarrollo de programas de extensión zoosanitaria dirigidos a los principales problemas a nivel de finca, c) el establecimiento de medidas cuarentenarias en base a situaciones que impliquen un riesgo real de diseminación de enfermedad o plaga, d) la reducción de restricciones zoosanitarias innecesarias al comercio internacional pecuario, e) la dirección de los proyectos de investigación en salud animal hacia la solución práctica de los problemas reales, f) la revisión de los programas de educación veterinaria para dirigirlos hacia la solución de los problemas reales en ese campo, g) la planificación más efectiva de la industria privada de productos veterinarios y del desarrollo y distribución de sus productos, h) la definición más adecuada de las instituciones internacionales de sus estrategias de apoyo a los países.

El IICA, convencido de la importancia de conocer la repercusión de las enfermedades y plagas, no sólo en la producción pecuaria, sino en la producción agrícola en general, ha iniciado proyectos en América Latina y en el Caribe para contribuir a conocer esa problemática.

La presente recopilación bibliográfica está dirigida a tratar de hacer un recuento de los principales trabajos publicados en los últimos años, sobre pérdidas por enfermedades y plagas de animales, con el propósito de que los mismos sean un punto de partida para el análisis del impacto económico de los problemas zoosanitarios en el Hemisferio Americano.

La labor de búsqueda en las bases de datos, organización y edición de la información fue realizada por la Lic. Lina Román, del Centro Interamericano de Documentación e Información Agrícola-CIDIA. La información fue obtenida de las Bases de Datos AGRIS/FAO y CAB Abstracts.

INSTRUCCIONES PARA SOLICITAR FOTOCOPIAS

Las referencias bibliográficas acompañadas de un asterisco (*), indican la existencia de los documentos en las colecciones de la Biblioteca Conmemorativa Orton del Centro Interamericano de Documentación e Información Agrícola CIDIA.

El CIDIA, mediante los Servicios de Reproducción de Documentos y de Remisión a otras Fuentes de Información, atenderá los pedidos de fotocopias.

Para aquellos documentos disponibles en el CIDIA, se debe proceder como se explica a continuación.

-- Calculando el número de páginas de acuerdo con la cantidad indicada en la cita bibliográfica y enviando la solicitud incluyendo el pago correspondiente.

-- La fotocopia tiene el siguiente precio:

América Latina y el Caribe	US\$0.10 por página
Otros países	US\$0.20 por página

-- Si el documento no está disponible en el CIDIA, aconsejamos al usuario verificar si lo puede localizar en las bibliotecas del país de residencia.

-- Agotada esta posibilidad, el CIDIA indicará a vuelta de correo de la solicitud, la dirección de la Unidad de Información respectiva donde se encuentra ubicado el documento para que el interesado solicite las fotocopias directamente.

-- Dirija su solicitud a:

Biblioteca Conmemorativa Orton

Turrialba, Costa Rica

INTRODUCTION

For centuries, countries throughout the world have waged a battle against animal diseases and pests that decrease production, limit productivity, hinder trade and pose a threat to public health.

Farmers and authorities have joined forces to decrease the impact of these problems by using the most advanced knowledge at their disposal for diagnosis, prevention and control.

Without a doubt, the progress made to date in arriving at an overall picture of animal health problems, in developing technology for the diagnosis and production of biologics and pharmaceutical products for prevention and control, and the eradication of specific diseases and pests in some countries, are important steps toward improving health conditions in livestock production.

Nonetheless, only recently have systematic studies been made on the direct and indirect economic impact of diseases and pests on livestock production, productivity and marketing.

Even though affected sectors have always been aware of the economic importance of these problems for their livestock production, studies accurately evaluating real losses have been very limited.

Important advantages can be obtained in the following areas with what is learned about the distribution and economic impact of these diseases and pests: a) the definition of priorities to implement official control and eradication programs, b) the development of animal health extension programs geared to the principal problems that exist at the farm level, c) the establishment of quarantine measures based on situations that involve the risk of spreading the disease or pest, d) the reduction of unnecessary animal health restrictions in international livestock trade, e) the orientation of animal health research projects toward practical solutions of real problems, f) the revision of veterinary education programs to guide them toward solving real problems that exist in the field, g) more effective planning of the private industry of veterinary products and of the development and distribution of these products, h) a more satisfactory definition by international institutions of their support strategies in the countries.

IICA, convinced of the importance of knowing what the repercussion of diseases and pests is, not only in connection with livestock production, but also with agricultural production in general, has initiated projects in Latin America and the Caribbean to contribute to the body of knowledge that exists on these problems.

The present bibliographic listing is intended to provide a compendium of the main papers published over the past years on losses due to animal diseases and pests, which can serve as a starting point for the analysis of the economic impact of animal health problems in the American hemisphere.

Ms. Lina Román, of the Inter-American Agricultural Documentation and Information Center (CIDIA), made the search of the data base and organized and published the information. The information was obtained from the AGRIS/FAO Data Base and CAB Abstracts.

Héctor Campos
Deputy Director for Animal Health
IICA

HOW TO REQUEST PHOTOCOPIES

Bibliographic references with asterisks indicate that the document is available at the Orton Memorial Library of the Inter-American Center for Agricultural Documentation and Information-CIDIA.

CIDIA will attend requests for photocopies through its Documents Reproduction and Referral Services.

- If the publication is available at CIDIA, determine the number of pages in each document as indicated in the bibliographic reference, and send us your completed order form, along with the corresponding payment.
- The prices of photocopies are as follows:

Latin America and the Caribbean	US\$0.10 per page
Other Countries	US\$0.20 per page

If the publication is not available at CIDIA we suggest that you contact the libraries in your country. If you can not find the publications in either of these possibilities, contact CIDIA again and we will refer you to the respective Information Unit where the document can be requested.

Please send your request to:

 AB : Errors in mixing anticoccidial drugs into feed have resulted in outbreaks of coccidiosis due to underdosing, and errors in overdosing have also brought on economic losses due to the toxic effects of too much drug. Errors, as indicated by feed analysis, for drugs outside of legal range are much more common than generally recognized. Underdosing errors are about twice as frequent as overdosing errors. High percentages of feed samples have been found to be out-of-compliance with label claims by state regulatory agencies even though feed manufacturers know that state regulatory agencies will be sampling and analyzing their feeds for drugs and other ingredients. To secure coccidiosis prevention and to avoid toxic overdosing, every feed manufacturer needs a program to constantly monitor drug levels in the feed. (EN)

AB : The results of hemagglutination inhibition test (HI) for parvovirus (PPV) antibodies indicated a high incidence of PPV infection among swine in the Philippines. PPV is associated with naturally occurring reproductive diseases which is now causing a great economic loss in the swine industry. The virus is spread between farms mainly through transfer of young gilts and boars at the time of infection. Accordingly, care must be taken in the introduction of new stock especially imported breeders into the herd. Further studies should be done because PPV had been isolated from pneumonia and rhinitis cases in other countries. (EN)

 AB : Coccidiosis of chicken cause significant economic losses especially in broiler and pullet growers. Losses due to mortality and growth retardation following a severe outbreak may be devastating in field. The aims of this study were designed to follow the incidence of coccidiosis in domestic broiler chicken raised in 8 provinces. An attempt was also made to differentiate and characterize the field isolates of coccidia judging from their morphological and biological features. When a total of 5,390 broiler from 321 flocks were examined for coccidiosis, positive diagnosis was made on 1,552 individuals (28.8%) and on 241 flocks (75.1%), respectively. (EN)

AB : Osteoporosis is a major cause of **economic losses** in broilers. Examination shows enteritis, retardation of growth, poor feathering, rickets and crazy chick disease (encephalomalacia) in some cases. It is almost beyond doubt that the disease is infectious and that contamination may persist on a farm over a prolonged period. To produce all clinical features, the birds should be infected during the first days of life. The incidence of osteoporosis in successive flocks may be reduced by thorough cleansing and disinfection with a 10% solution of commercial formalin. Treatment of affected flocks with antibiotics for 3-4 days plus administration of additional vitamins A, D(3), E and K for 10-14 days will usually result in more rapid restoration of growth. **Economic losses** may be considerably reduced by combining thorough cleansing and disinfection with the treatment of affected flocks.  AB: : It has long been believed for the presence of infectious coryza affecting serious economic loss of domestic poultry industry. However, the etiologic agent has not been isolated until quite recently. From 1979, several strains of Haemophylus-like organism were isolated from chickens with symptoms similar to infectious coryza, and their colonial morphology, growth requirement, biochemical properties and pathogenicity were assessed. In addition, serological properties of the isolate by cross hemagglutination inhibition test was also investigated. The results indicated that all the isolates were identified as Haemophilus gallinarum which had similar characteristics to the reference strains. (EN)

Fecha Devolución _____ **Nombre del solicitante** _____

A hand-drawn graph on lined paper. It features a vertical y-axis and a horizontal x-axis intersecting at the center. The parabola opens downwards, with its vertex located in the upper-left quadrant. The curve passes through several points plotted on the grid, showing a negative correlation between x and y.
