## INTRODUCTION

There is worldwide revolution in microcomputer technology underway and scientists are struggling to find ways to utilize this new technology to help solve developing problems.

The Ministry of Agriculture and Natural Resources(MANR) Planning Unit has developed considerable experience in using microcomputers in agronomic research and numerical data bases through its work with the Inter-American Institute for Cooperation on Agriculture(IICA). A Wang P.C. is in operation since November 1984 and methodologies and application software has been developed accordingly.

## HARDWARE:

Planning Unit's microcomputer is running on a lease with purchase option basis from November 1984 to March 1986. The configuration is as follows:

- WANG P.C. 256 Kbytes, Dual Disk Drive, Graphics Card, Intel 8086 Microprocessor, 8 MHZ Clock Speed and 5½" DSDD.
- Matrix parallel Printer
- Letter Quality Printer
- Keyboard
- Monochrome Monitor

## SOFTWARE

At Planning Unit the following interactive software packages are in operation.

1. System Software, Industry Standard

- MS-DOS Operating System
- Microsoft Basis-86 interpreter
- Library of Utilities

2. Application Software. Complete document compatibility with other WANG System also communications option.

- Multiplan Electronic Spreadsheet: Ready to use with financial planning and modeling, budgeting and forecasting, payroll and benefit cost analysis.
- Data Base: To define the organization and elements of each Data Base, design screen for data entry, Perform data entry and reporting, modify, delete and manipulate data, create reports as a Wang Word Processing Document and creates a file which is Multiplan compatible.
- Business Graphics: Handles sophisticated business charting needs, plots lines, draws bar charts and manipulates data in statistical meaningful presentations.
- Word Processing: Plenty of facilities to merge, page, sort, copy, delete documents, automatic centering, pagination and underscore, finally decimal tabulation.

3. Statistical programs. Developed at Planning Unit to support research and extension of MANR's Units.

- ONE WAY. Performs a one-way analysis of variance (ANOVA) to compare the means of data divided into several classes.
- TWO WAY. Perform a two-way analysis of variance (ANOVA) to compare the means of a variable dependent upon two factors or classes.
- THREE WAY. Perform a two factor analysis of variance (FACTORIAL AXB) to compare main effects and interactions.
- FOUR WAY. Perform a three factor analysis of variance (FACTORIAL AXBXC) to compare main effects first order interactions and second order interactions.
- SPLIT PLOT. To be used when an additional factor is to be incorporated in an experiment to increase its scope. Perform a whole plot and subplot analysis of variance.
- SPLIT-SPLIT PLOT. Performs a whole plot, subplot and sub-sub plot analysis of variance (with different precision).
- DUNCAN. Performs comparisons among treatment means. Compares each treatment mean with every other treatment mean.
- CORRELATION. Computes the pair-wise correlation coefficients between variables.

- LINEAR MODELS. Computes the linear regression equation relating the dependent variable to one independent variable according to the menu of options:

1. Linear regression
2. Semilogarithm regression
3. Logarithm regression
4. Geometric regression
5. Exponential regression
6. inverse regression

- MULTIPLE REGRESSION. Computes the linear multiple regression equation relating the dependent variable to one or more independent variables. Performs analysis of variance and standard error of parameter.

- STEPWISE. A technique to find which variables of a collection of independent variables should most likely be included in a regression model.

- DISTRIBUTION. To evaluate exact probabilities for the following distribution functions. .

1. CHI-SQUARE
2. FISHER'S F
3. NORMAL Z
4. STUDENT'S T

4. Statistical Packages. A statistical package is defined as a software package which computes any of the commonly accepted statistical tests over and above descriptive statistics.

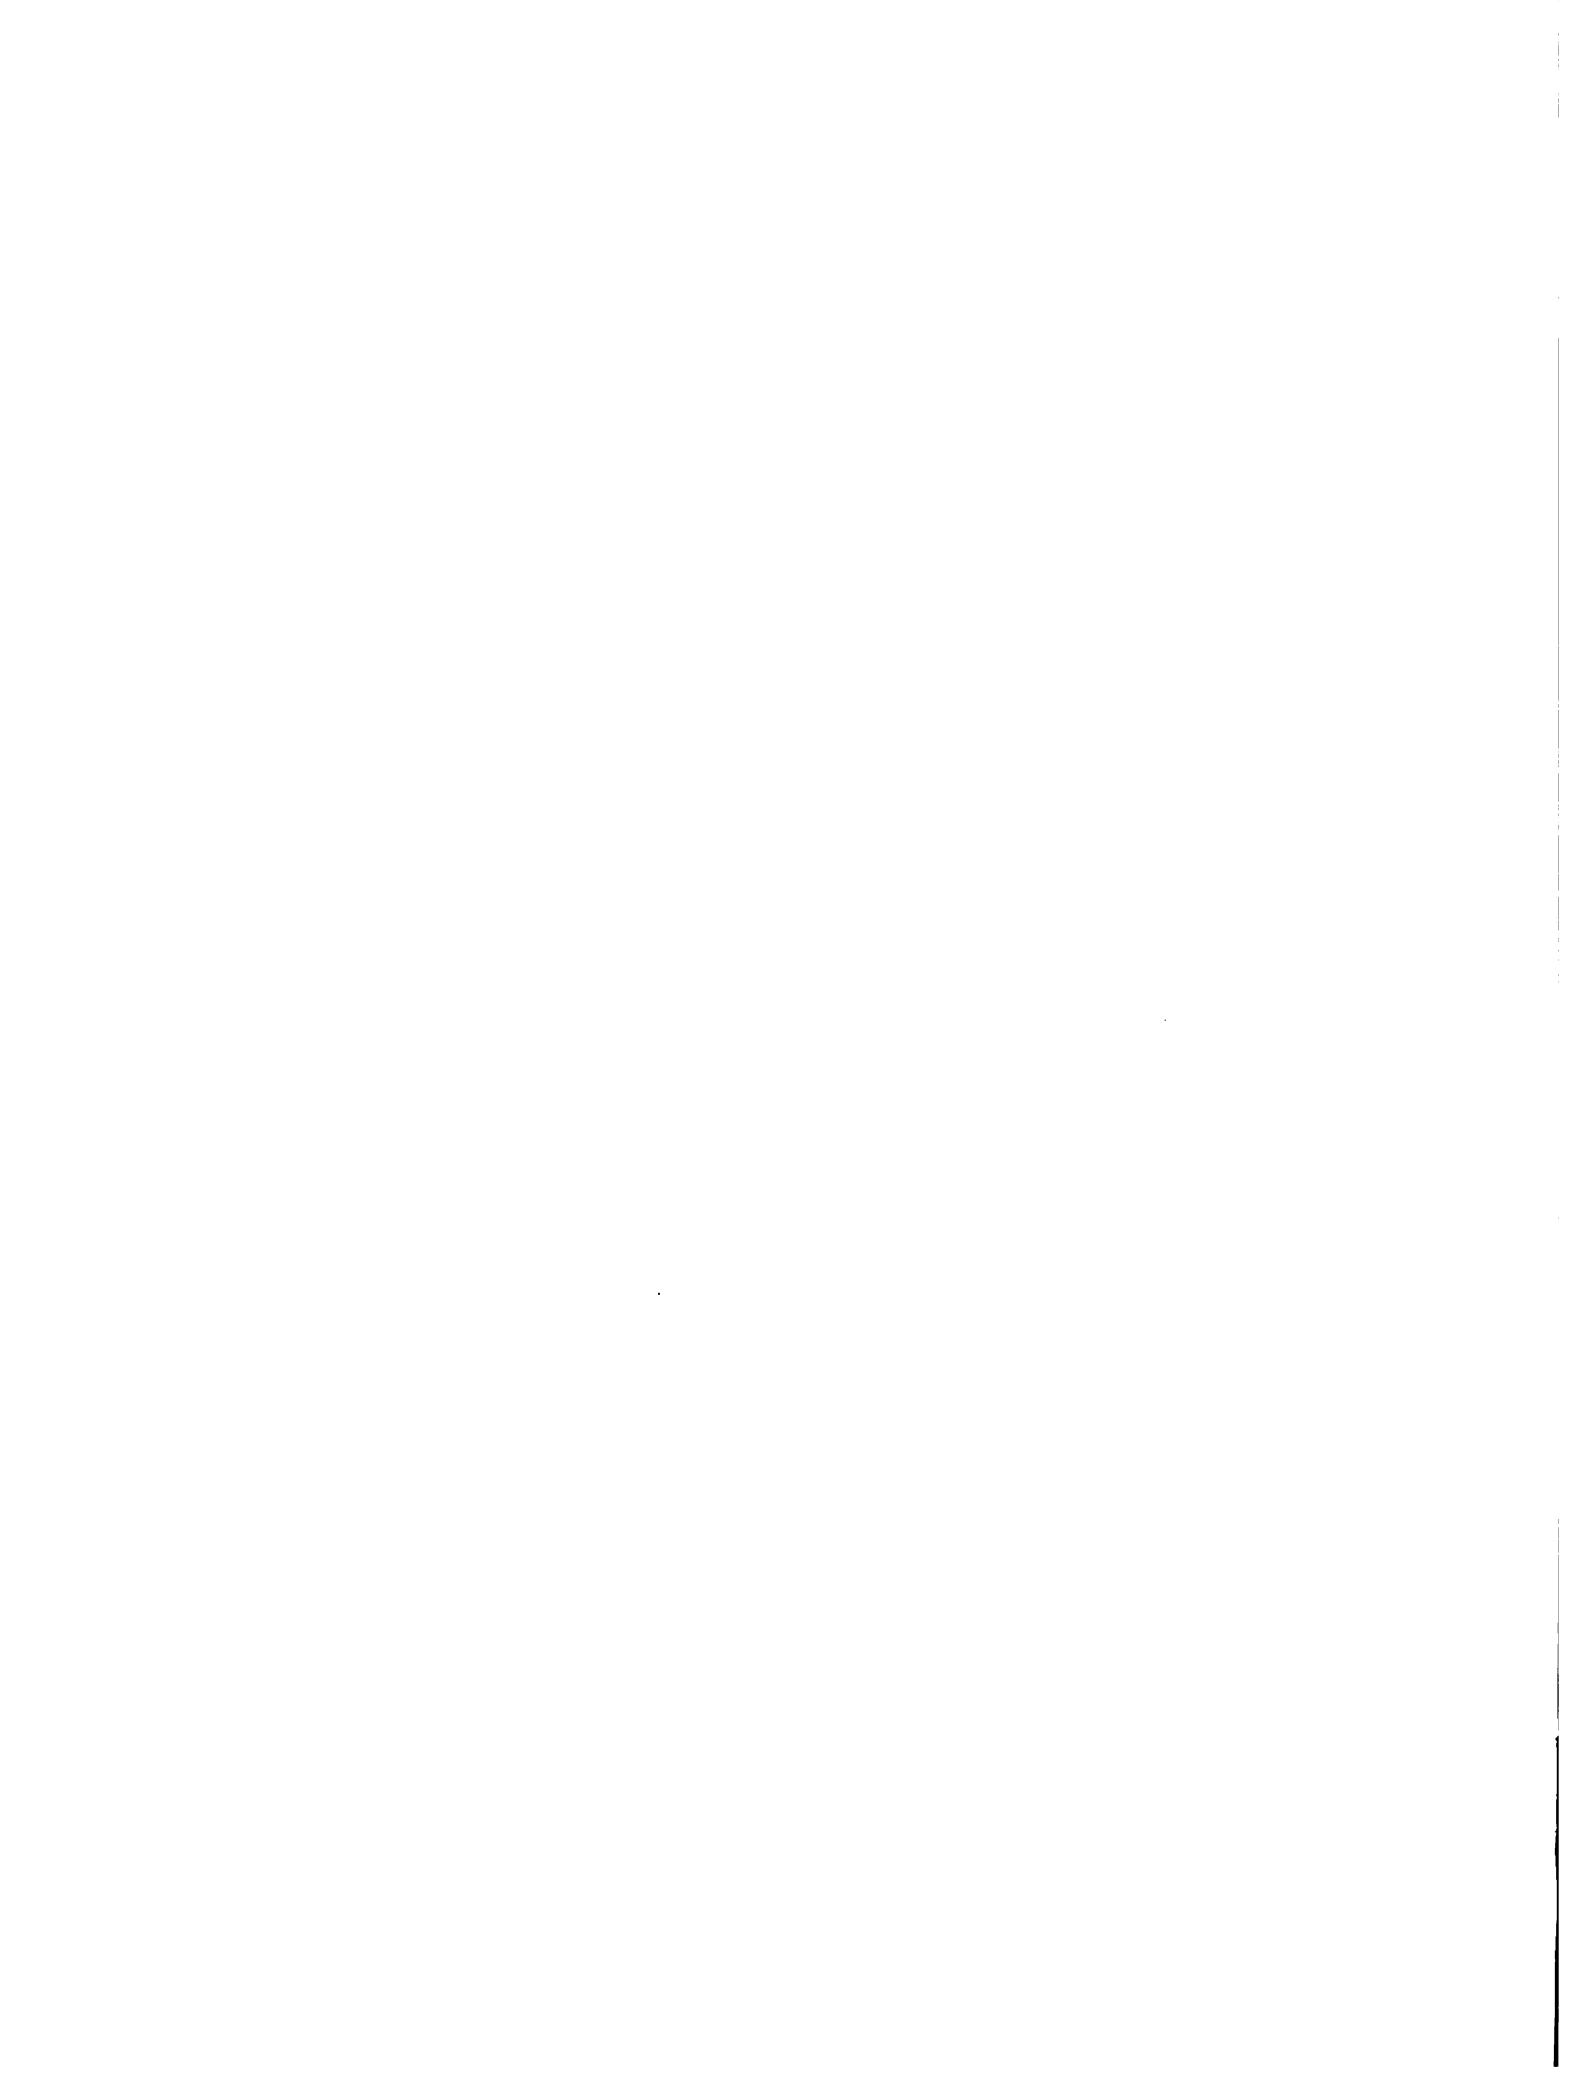

- MSTAT. A microcomputer program developed at Michigan State University for the design, management, and analysis of agronomic research experiments. We use it at Planning Unit because its easy access, low cost, user friendly, data security and product support. Some functions of the package are:
  - Merges two MSTAT files end-on-end
  - Computes a one-way analysis of variance
  - Computes a two-way analysis of variance
  - Computes a lattice analysis of variance
  - Creates blank data cases
  - Prints books for breeding material
  - Prints labels for breeding material
  - Updates generation and prints pedigree
  - Computes conversion of data using BASIC equations
  - Computes simple correlations and regression
  - Data entry procedures

- Creating new variables
- Marginal returns analysis
- Prints field books based on EXPPLAN
- Print labels based on EXPPLAN
- Prints field maps of EXPPLAN
- Generates CRD and RCB designs
- Computes freq & histograms of data variables
- Creates MSTAT files from ASCII files
- Reformation of MSTAT files from TOTEMP files
- Groups data values into specific group categories
- Heirarchical analysis of variance
- Screen listing and editing of data
- Computes and stores means in an ASCII file
- Computes multiple regression for ind/dep variables
- Renaming variables
- Renaming file title
- Computes a nonorthogonal analysis of variance

- Creates an X-Y scatter plot of any two variables
- Listing of data files on a printer
- Computes within & between group regr anal & ANOVA
- Explanation of selection setup
- Creates new files using selection data
- Sorts data with 4 levels of keys
- Computes summary statistics of variables
- Tabular transformation of data
- Creation of ASCII files
- Prints field books of VARPLAN
- Creates and prints field maps of VARPLANS
- Creates varietal name and accession number files
- Creates yield trial designs based on VARNAME data
- S.S. Is a system survey package to evaluate data collected through sampling survey and census. At Planning Unit two (2) surveys have so far been evaluated: Fisheries and Integrated Livestock Survey. Performs: descriptive statistics, cross tabulations, relation analysis and data base functions.

STATISTICAL PACKAGE

## Data Definition

- Up to 32,600 cases with 200 variables
- Reads ASCII files
- Variable & Value Labels
- Missing Values
- Handles integer, real or alphanumeric data
- Compatible with database systems

## Data Transformations

- RECODE - Categorize variables
- COMPUTE new variables with algebraic equations and functions
- IF - Conditional COMPUTE statement
- SELECT IF - Select cases for processing

+ - \* /  
SQRT SIN LN and more  
EQ NE GT GE LT LE  
AND OR NOT
